WebWay

IP/GPRS for business security

Reduce costs, not security

Switch to digital savings

WebWay IP/GPRS connects your security systems to your shared broadband line for fast, secure and reliable alarm transmission, servicing and diagnostics. Using your WebWay IP/GPRS for intruder, fire and property management communications reduces the number of telephone line rentals (up to £166 per annum, per line), call charges and visits for key holders and engineers.

WebWay advanced alarms

WebWay turns your alarm data into alarm information. Information associated to any part of the alarm system can be transmitted so you can monitor rear/exit doors, entry/exit times for premises maintenance staff or identify not only when a premises was open/closed, but by which fob. Intruder alarms include site ID, date, time, zones and site specific data.

WebWay integrates to signal:

- ✓ Intruder, fire and audio systems for transmission over shared broadband
- ✓ Up to 48 trigger events to monitor other property management systems i.e. fridges, temperature
- ✓ Detect fault or tamper of other network connected equipment and reboot
- ✓ Remotely service or manage alarm panels
- ✓ Remotely upgrade the WebWay system

Protected premises, protected network

WebWay network monitoring

Your premises are protected by your alarm system; the communications networks between your premises and the alarm receiving centre are protected by WebWay. WebWay transmits alarms in less than 2 seconds over IP or GPRS and detects faults/attacks within 3.5 minutes, in the following critical scenarios:

- Intruder alarm followed by
 - Loss of one communications path
 - Loss of both communications paths
- Loss of one communications path followed by
 - Intruder alarm
- Loss of both communications paths
- Equipment failure

Security and reliability

WebWay is the most robust signalling solution in the UK. Our systems use dual path encrypted communications, signalling over fixed line private or public broadband connections and Telefonica's network of over 13,000 GSM/GPRS base stations. Every path of every system is checked for operation more than 140,000 times per week. Polling and alarms are sent directly from the Alarm System to the Alarm Receiving Centre with no intermediate host for the highest reliability, resilience and security.

*Integrated intruder, fire, audio and property management signals
IP and GPRS communications, monitored 24 hours a day
Serial data interface to alarm panel, advanced alarms and service
Up to 48 channels, fridge, temperature etc
3 controllable outputs
Activated SIM and GPRS contract, all inclusive
Antenna upgrades include roaming at no additional ongoing charges
Engineer support, performance reports
